(57) Abstract :

ABSTRACT A SYSTEM AND METHOD FOR AUTOMATED MEDICATION DISPENSING AND ADHERENCE MONITORING The present invention pertains to the system and method of automated medication dispensing and adherence monitoring. The system consists of a medication management controller, a scheduling component for recognizing scheduled medication administration, an authentication component for authenticating the intended recipient, a medication dispensing component for providing selective access to a specific medication compartment, a retrieval verification component for verifying medication retrieval, an adherence determination component for determining medication-adherence status, and a communication component for communicating medication information. This system further implements multi-stage adherence verification using schedule information, authentication information, dispensing information, retrieval information, inventory information, and user confirmation information. Generation of reminders, adherence notifications, missed dose notifications, caregiver notifications, inventory notifications, and emergency notifications can take place using cloud and/or cellular communications.
